

WebClock™

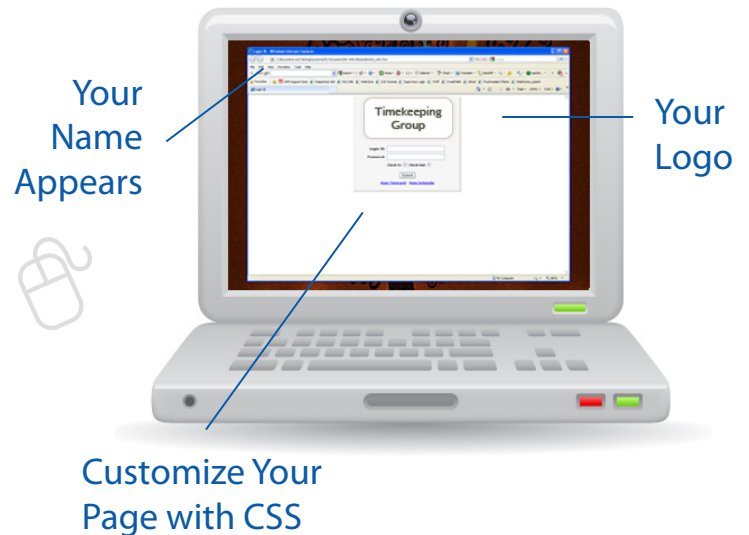

Realtime PC Based Punching

New Release: WebClock 2.0

New Release: WebClock 2.0

Get increased functionality, brand awareness and employee security with the release of the new WebClock 2.0.

Employers will gain a variety of feature enhancements that improve the usability of web-based punching, from multiple time zone integration to customizable webpage branding with Cascading Style Sheet (CSS) support.

Update Overview

Key Feature Enhancements

WebClock 2.0 offers supervisors increased visibility with the ability to record and view the IP address of each employee punch through a non-editable IP audit log.

Have employees across multiple time zones? Managers and payroll administrators will now be able to customize Time Zone settings by employee.

For branding purposes, display your company name in the URL, login frame, and even take advantage of CSS design rules to further customize your WebClock "look and feel."

Peace of Mind - Security

Punch more securely! Because WebClock clears form data between users, the potential risk of displaying the previous user's login data is eliminated.

Web-based punching can now be set at a "per-URL" level so that payroll administrators will not be restricted by duplicate employee login ID's.

To further minimize the potential for service disruptions, database maintenance will be even more seamless as additional backups of employee rosters are held on

WebClock: Web-Based Punching

WebClock brings you the ease of web-based automated timekeeping, offering employees the ability to clock in and out through a web browser, and supervisors the convenience of editing and reporting employee time cards from any web-enabled workstation.

Punching can even occur through mobile devices with a web browser.

With no software to install and no hardware to maintain, managing your employee's time cards in real time has never been more simple

WebClock Overview

Employee Online Access

With WebClock, employers can offer their employees the convenience of not only clocking in/out online, but also the opportunity to check their time card and schedule from any standard web browser. You'll be reassured knowing that your employees will be more accountable and more in tune with their own punch performance.

Punch Restrictions by IP Address

In addition to the use of SSL to secure your employee's punch data WebClock offers the ability to restrict employee punches to only authorized workstations based on an IP Address.
